START THE DIVING ADVENTURE

SCUBA DIVING IS A MODE OF UNDERWATER DIVING WHERE THE DIVER USES A SELF-CONTAINED UNDERWATER BREATHING APPARATUS, WHICH IS COMPLETELY INDEPENDENT OF SURFACE SUPPLY, TO BREATHE UNDERWATER.

DO'S AND DON'TS

Don't exhale too much air in one go when 10ft below. *As you exhale by force, you rapidly increase pressure to your surroundings causing your body's volume to decrease, and instead of going up the water, you will sink according to Boyles law that when pressure increase then the volume decreases*

Do breathe correctly and carefully as you swim out of the water. *As you control your breathing, you can get back up the water without losing the volume of your body that lifts you up According to Boyle's law, when pressure is low then the volume will remain high*

Wear dry suits. *A dry suit is a watertight garment worn by divers that serve to keep the diver warm by trapping a layer of air between the diver and the suit. During the dive, divers can add and remove air from their dry suits through their regulators. This allows them to adjust for changes in their suits' gas volumes due to pressure changes during ascent and descent.*

A SCUBA INCLUDES METAL TANKS THAT HOLD COMPRESSED AIR, A REGULATOR TO REDUCE THE TANK AIR PRESSURE TO BREATHABLE AIR, AND A HOSE THAT CARRIES THE BREATHABLE AIR INTO THE DIVER'S MOUTH. WHEN A DIVER EXHALES, AIR IS RELEASED INTO THE WATER AND CREATES LITTLE BUBBLES.
